### **ASBV's Definitions**

Australian Sheep Breeding Value's (ASBV's) are an estimate of the genetic potential a sheep will pass onto it's progeny and are designed to be used in conjunction with a visual assessment.

- YCFW** Yearling Clean Fleece Weight (%) estimates the genetic difference between animals for Clean Fleece Weight at 360 days of age. Rams with higher figures for YCFW will produce progeny that will cut more wool.
- YFD** Yearling Fibre Diameter (Micron) estimates the genetic difference in fibre diameter at 360 days of age. Rams with more negative figures will produce progeny with a finer micron.
- YWT** Yearling Weight estimates the genetic difference in yearling weight at 360 days of age. The higher the YWT figure, the more likely rams are to produce progeny that grow more quickly and are heavier at a certain age.
- YEMD** Yearling Eye Muscle Depth estimates the genetic difference in Eye Muscle Depth at the C site at 60Kg liveweight.
- YFAT** Yearling Fat estimates the genetic difference in GR fat depth at 60Kg liveweight.

### **Indices**

- DP+** Dual Purpose - This index ranks animals on their ability to produce merinos for a dual purpose operation.
- MP+** Merino Production - This index ranks animals on their ability to produce progeny for wool operation that's income is a balance of both surplus sheep sales and wool.
- FP+** Fibre Production - This index ranks animals on their ability to produce merinos for a wool production operation.
