ASBV's

Australian Sheep Breeding Values are an estimate of an animal's true breeding value, based on its pedigree and the performance recorded data. The more data collected upon its pedigree and progeny, will be thereby improve the estimates.

ASBV's are essentially a projection of how that animal's progeny may potentially perform for a range of traits.

ASBV's cannot replace visual and physical assessment of the animal.

Indicies Explained

YWT - Yearling Weight estimates the genetic difference in yearling weight at 360 days of age. The higher the YWT figure, the more likely rams are to produce progeny that grow more quickly and are heavier at a certain age.

YFD - Yearling Fibre Diameter (Micron) estimates the genetic difference in fibre diameter at 360 days of age. Rams with more negative figures will produce progeny with a finer micron.

YCFW - Yearling Clean Fleece Weight (%) estimates the genetic difference between animals for Clean Fleece Weight at 360 days of age. Rams with higher figures for YCFW will produce progeny that will cut more wool.

ACFW - Adult Clean Fleece Weight (%) estimates the genetic difference between animals for Clean Fleece Weight at greater than 22 months of age. Rams with higher figures for ACFW will produce progeny that will cut more wool.

Fine Wool (FW) index

The Fine Wool index is based on a production system where the majority of income is from the wool clip. Reducing the micron of the wool is a strong focus within this index. The production system modelled in the Fine Wool index is based on producing 15-17 micron wool from the breeding flock and a mixed age wether flock. The wool to meat income ratio of the production system is 75:25 weighted towards wool.

In addition to improving wool traits and reproduction, the index also has emphasis on reducing wrinkle and worm egg count.

Wool Production (WP) index

The Wool Production (WP) index is based on a production system where the majority of income is from the wool clip with a strong focus on wool production. The production system modelled for the Wool Production index is a self-replacing system producing 16-18 micron wool from the breeding flock and a mixed age wether flock. With a wool to meat income ratio of 71:29 for this production model, the index focuses on genetic improvement of fleece weight, fibre diameter, staple strength, and reproduction, along with emphasis to reduce wrinkle.
